Figure 2. Schematic of the expected coefficient of variations (CVs) analyses conducted using SBRM 2009, 2010, and 2011. Boxes shaded in yellow represent analyses where the SBRM standard sea days and the species group variances are associated with one SBRM analysis (no lag is data used); boxes shaded in light-green represent analyses where the SBRM standard sea days and species group variances are associates with two SBRMs, separated by one year (1-yr lag); boxes shaded in dark-green represent analyses where the SBRM standard sea days and species group variance are associates with two SBRMs, separated by two years (2-yr lag). The table containing the results of the expected CV analysis is also given.
